

First day

Brayman Construction. Calibrayt. 7 October 2026.

Use the Mac office Joel has started. Open <http://127.0.0.1:5001> and sign in. Do not use the website.

1. Add the customer under Clients if they are not there yet.
 2. Home. + Start New Project. Name and client are required.
 3. On the project, Review location. Street, municipality, and province.
 4. Documents. Upload the plan PDF you already have. The permit report is not a permit.
 5. New estimate. Add the lines you know. Do not invent the rest.
 6. On an approved take-off package, Map to estimate, then Insert into estimate.
 7. Scope Delivery Review. Confirm material and labour. Then costing review. Type your own name. Approve all costing.
 8. Apply org pricing policy.
 9. Create Proposal. Download PDF. Title is CONSTRUCTION ESTIMATE. Read it before it leaves the office. Acceptance is Update status, then Accepted.
 10. Contract. Calibrayt uses the active Brayman V1 Ontario contract package. The package and version are on the contract snapshot. If it says Production contract unavailable, stop. Do not bypass it. Family 05 is the presentation page, not a different contract. Generating a contract does not send a signing link.
 11. Supplier Estimate Request only when the material list and the supplier are selected. This Mac supplier account is labelled DEMO / SYNTHETIC. Prices stay blank.
 12. Field. Confirm the project, then Capture. Check Field Observations.
 13. Lock the estimate version. Then Money shows the committed baseline. Enter an actual cost only when you know the amount.
- If something looks wrong, stop and call Joel Brayman. Do not delete the project. Do not rename the office file.
- Joel made the 7 October 2026 backup. He runs the backup sheet again after a day a real project changed.
